Assignment 02

In data structure and algorithms context. discuss the following:

- Data Structure
- Data
- Abstract Data Types
- Algorithms

1. Data Structure is a specific way of organizing and storing data in memory so that it can be accessed and modified efficiently.

   Examples: Array, Linked list, Stack, Queue, Tree, Graph, Hash table.

2. Data is raw facts, figures, or information that have not been processed or organized. Data is what we store in memory and manipulate using data structures. Then algorithms process that data to give us useful information or results.

3. Abstract Data Types is a logical description of a data type and the operations that can be done by it without showing how it is implemented. ADT gives us a blueprint. It separates the design from the implementation so we can change the internal details without affecting the program that uses it.

4. Algorithm is a step by step set of instructions to solve a problem or perform a task using data. Algorithms work on data structures. A good algorithm is measured by time complexity and space complexity.
